Tugas Besar PMC 2022

INTRODUCTION

Minimisasi logika → proses penyederhanaan fungsi boolean

- 3 cara minimisasi logika:
- Teorema Aljabar Boolean
- Metode Karnaugh Map (K-Map)
- Metode Tabular

Input:

- Jumlah variabel (1-12)
- Jumlah minterms
- Minterm (0-2^(jumlah variabel-1)

Output:

- Tabel prime implicants
- Simplified Boolean expression

Referensi:

02643/sourcecode/McQuicksy.c#.YlGuFch
Bw2w

Mengubah minterms dari bentuk desimal menjadi bentuk binernya

Step 2

Mengelompokkan bilangan-bilangan biner tersebut ke dalam beberapa grup berdasarkan jumlah angka '1' dalam bilangan binernya. Setelah dikelompokkan, program akan membandingkan seluruh bilangan biner pada grup ke-n dengan seluruh bilangan biner pada grup ke-(n+1)

Testcase

https://geeekyboy.github.io/Quine-McCluskey-Solver/#/

Jumlah Variabel	Jumlah Minterms	Minterm	Hasil kalkulator
4	8	0, 1, 3, 7, 8, 9, 11, 15	bc + CD
8	6	2, 24, 60, 124, 200, 254	abcdefGh + abcDEfgh + ABcdEfgh + ABCDEFGh + aCDEFgh
12	4	1, 4000, 4050, 4095	abcdefghijkL + ABCDEfGhijkl + ABCDEFgHijKl + ABCDEFGHIJKL
